Enics establishes high-performance manufacturing site in Malaysia

Enics is expanding its presence in Asia with a new high-volume manufacturing site to be opened in Malaysia in early 2021.

Enics, one of the world's largest electronics manufacturing service companies, announces that it has signed a contract with the I-Park industrial area in Senai, Malaysia, adjacent to Johor Bahru and Singapore, for construction of a new manufacturing site. With this, Enics extends its presence in Asia enlarging the production network to 8 manufacturing and engineering sites in Malaysia, Europe and China.

"Malaysia, being a global hub in electronics manufacturing, is an obvious choice for Enics' expansion in Asia" comments Enics' President and CEO **Elke Eckstein**. "Availability of supply chain, skilled workforce and logistics make Malaysia and especially Johor Bahru region an attractive environment for a global electronics manufacturing company like Enics. The new site will be a streamlined, highly automated electronics manufacturing unit, offering high-volume manufacturing solutions and services to our valued customers."

The new manufacturing site building, covering 10.000 sqm, is constructed over the coming months and production line equipment will be installed during last quarter of 2020. The site will be inaugurated and starts its production in early 2021.

About Enics

Enics is the partner of choice for professional electronics in the fields of energy, industrial automation, transportation, building automation and instrumentation. As one of the largest electronics manufacturing services (EMS) providers in the world in the Industrial Electronics segment, Enics helps industrial OEMs to optimize their value chains and improve their competitiveness through increased productivity and product reliability as well as decreased time-to-money and total cost of ownership. Enics provides end-to-end EMS services ranging from engineering, full-scale manufacturing and after sales services to sourcing and supply chain management. Enics' world-class offering includes fast prototyping, new product introduction, cost reduction services, test system development, printed circuit board assembly, box build, system assembly, as well as repair and maintenance.
